WARNING
This manual must only be used by a qualified heating installer/service technician. Read all instructions in this manual before installing. Perform steps in the order given. Failure to comply could result in severe personal injury, death or substantial property damage.
CONTENTS

Part 1 – Product and Safety Information ................................................................. 3, 4

Part 2 – How The Boiler Operates ................................................................. 5-9

Part 3 – Prepare Boiler Location ................................................................. 6-12
  A. Boiler Location Should Be Level
  B. Installations Must Comply With:
  C. Before Locating Boiler
  D. Clearances for Service Access
  E. Residential Garage Installation
  F. Exhaust Vent and Intake Air Vent
  G. Prevent Combustion Air Contamination
  H. When Removing a Boiler from an Existing Common Vent System

Part 4 – Prepare Boiler ................................................................. 12
  A. Remove Boiler from Box

Part 5 – Boiler Piping ................................................................. 12-24
  – Boiler Piping Details ................................................................. 18-24
    A. Relief Valve
    B. General Piping Information
    C. Separate Low Water Cutoff
    D. Backflow Preventer
    E. System Water Piping Methods
    F. Circulators
    G. Hydronic Piping with Circulators, Zone Valves and Multiple Boilers
    H. Circulator Sizing
    I. Fill and Purge Heating System

### Part 8 – Gas Piping .......................................................... 45-47
   A. Gas Connection
   B. Gas Piping
   C. Gas Table
   D. Dungs Gas Valve

### Part 9 – Field Wiring ...................................................... 47-49
   A. Installation Must Comply With
   B. Field Wiring
   C. Line Voltage Wiring
   D. Thermostat

### Part 10 – Field Wiring – Vision 1 ..................................... 50

### Part 11 – Start Up Preparation ......................................... 51-53
   A. Check/Control Water Chemistry
   B. Freeze Protection (when used)
   C. Fill and Test Water System
   D. Purge Air from Water System
   E. Check for Gas Leaks
   F. Check Thermostat Circuit(s)
   G. Condensate Removal
   H. Final Checks Before Starting Boiler

### Part 12 – Start-Up Procedure ........................................... 53-55
   A. Operating Instructions
   B. Adjusting the Set Point
   C. Status Menu
   D. Test Mode

### Part 13 – Start-Up Procedures With The Vision 1 Option ....... 55-58
   A. Programming the Vision I Option
   B. Vision I Program Access
   C. Vision I Program Navigation

### Part 14 – Trouble Shooting .............................................. 59-61
   A. Munchkin Error Code
   B. Boiler Error
   C. Boiler Fault

### Part 15 – Maintenance ..................................................... 61-66
   A. Maintenance Procedures
   B. Combustion Chamber Coil Cleaning Instructions

### Part 16 – Boiler Inspection and Maintenance Start-Up Charts .. 67-69
PART 1: PRODUCT AND SAFETY INFORMATION

SPECIAL ATTENTION BOXES

The following defined terms are used throughout this manual to bring attention to the presence of hazards of various risk levels or to important information concerning the product.

### DEFINITIONS

<table>
<thead>
<tr>
<th><strong>DANGER</strong></th>
<th><strong>CAUTION</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>DANGER indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.</td>
<td>CAUTION Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>WARNING</strong></th>
<th><strong>CAUTION</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>WARNING indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.</td>
<td>CAUTION used without the safety alert symbol indicates a potentially hazardous situation which, if not avoided, may result in property damage.</td>
</tr>
</tbody>
</table>

### WARNING

If the information in this manual is not followed exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

**WHAT TO DO IF YOU SMELL GAS**

- Do not try to light any appliance.
- Do not touch any electrical switch: do not use any phone in your building.
- Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.
- If you cannot reach your gas supplier, call the fire department. Installation and service must be performed by a qualified installer, service agency or the gas supplier.

### NOTICE

*Heat Transfer Products, Inc., reserves the right to make product changes or updates without notice and will not be held liable for typographical errors in literature.*
PART 1: PRODUCT AND SAFETY INFORMATION (CONT’D)

WARNING
Installer — Read all instructions in this manual, and Munchkin Venting section, before installing. Perform steps in the order given.
User — This manual is for use only by a qualified heating installer/service technician. Refer to User’s Information Manual for your reference.
User — Have this boiler serviced/inspected by a qualified service technician annually.

Failure to comply with the above could result in severe personal injury, death or substantial property damage.

WARNING
Failure to adhere to the guidelines on this page can result in severe personal injury, death or substantial property damage.

WARNING
WHAT TO DO IF YOU SMELL GAS
• Do not try to light any appliance.
• Do not touch any electric switch; do not use any phone in your building.
• Immediately call your gas supplier from a neighbor’s phone. Follow the gas suppliers’ instructions.
• If you cannot reach your gas supplier, call the fire department.

Before Installing
WHEN SERVICING BOILER
• To avoid electric shock, disconnect electrical supply before performing maintenance.
• To avoid severe burns, allow boiler to cool before performing maintenance.

BOILER OPERATION
• Do not block flow of combustion or ventilation air to boiler.
• Should overheating occur or gas supply fail to shut off, do not turn off or disconnect electrical supply to circulator. Instead, shut off the gas supply at a location external to the appliance.
• Do not use this boiler if any part has been under water. Immediately call a qualified service technician to inspect the boiler and to replace any part of the control system and any gas control that has been under water.

BOILER WATER
• If you have an old system with cast iron radiators, thoroughly flush the system (without boiler connected) to remove sediment. The high-efficiency heat exchanger can be damaged by build-up or corrosion due to sediment.
• Do not use petroleum-based cleaning or sealing compounds in boiler system. Gaskets and seals in the system may be damaged. This can result in substantial property damage.
• Do not use “homemade cures” or “boiler patent medicines.” Substantial property damage, damage to boiler, and/or serious personal injury may result.
• Continual fresh make-up water will reduce boiler life. Mineral buildup in heat exchanger reduces heat transfer, overheats the stainless steel heat exchanger, and causes failure. Addition of oxygen carried in by make-up water can cause internal corrosion in system components. Leaks in boiler or piping must be repaired at once to prevent make-up water.

FREEZE PROTECTION FLUIDS

CAUTION
NEVER use automotive or standard glycol antifreeze, even ethylene glycol made for hydronic systems. Use only inhibited propylene glycol solutions, which are specifically formulated for hydronic systems. Ethylene glycol is toxic and can attack gaskets and seals used in hydronic systems.

CAUTION
Consider piping and installation when determining boiler location. Any claims for damage or shortage in shipment must be filed immediately against the transportation company by the consignee.
**PART 2: HOW BOILER OPERATES**

*Munchkin Condensing Technology* is an intelligent system that delivers highly efficient hydronic heating, while maximizing efficiency by measuring the Data Parameters of your heating system.

1. **Stainless Steel Heat Exchanger**
   The highly efficient durable Munchkin Stainless Steel Heat Exchanger is designed to take the colder return water from the system and extract the last bit of energy before it is exhausted. The heat exchanger design is separated by an internal baffle which diverts the exhaust gas through the primary heat exchanger into the secondary heat exchanger where the colder return water extracts the last residual heat.

2. **Modulating Combustion System**
   Modulation during the central heating operation is based on the supply temperature. The set point used for the control depends upon the programmed central heating curve. The slope of the heating curve can be changed by the installer of the Munchkin in the sense that both turning points of the curve can be moved. The control monitors the system to regulate the output of the burner during operation to match the system demand. This increase in efficiency allows for substantial fuel savings.

3. **Gas Valve**
   The gas valve senses suction from the blower, allowing gas to flow only if the gas valve is powered and combustion air is flowing.

4. **Supply water temperature sensor**
   This sensor monitors boiler output water temperature (system supply). The control module adjusts the boiler firing rate so the outlet temperature is correct.

5. **Return water temperature sensor**
   This sensor monitors the return water temperature (system return). The control module reduces or increases boiler input, depending on how close the return water temperature is to the outlet water temperature.

6. **Temperature and pressure gauge**
   Allows the user to monitor the systems temperature and pressure.

7. **Control**
   The integrated control system monitors the return and supply water and regulates the fan speed to regulate the unit’s BTU output. This allows the unit to only deliver the amount of heated energy required and nothing more!

8. **Burner**
   Constructed of high grade stainless steel construction, the burner uses pre-mixed air and gas and provides a wide range of firing rates.

9. **Electrical field connections with terminal strips**
   The electrical cover plate allows access the line voltage terminal strip and the low voltage terminal strip. Attach line voltage conduits to the three holes at the right of the line voltage terminal strip for power, CH pump and DHW pump. Route low voltage wires through the opening to the left of the low voltage terminal strip. (See Field Wiring Instructions Part 9.)

10. **Condensate drain connection**
    This is a condensing high efficiency appliance, therefore this unit has a condensate removal system. Condensate is nothing more than water vapor, derived from the combustion products, similar to an automobile when it is initially started. It is very important that the condensate line is sloped away from the boiler and down to a suitable inside drain, if the condensate outlet on the Munchkin is lower than the drain, you must use a condensate removal pump (kit p/n 554200 available from Heat Transfer Products, Inc.) A condensate filter, if required by local authorities can be made up of lime crystals, marble or phosphate chips and will neutralize the condensate. This can be done in the field by the installer or you may purchase one from Heat Transfer Products, Inc. (P/N N1100). It is also very important that the condensate line is not exposed to freezing temperatures or any other type of blockage. Plastic tubing must be the only material used for the condensate line. Steel, brass, copper or others will be subject to corrosion or deterioration. A second vent may be necessary to prevent condensate line vacuum lock if a long horizontal run is used.
Also, an increase in pipe size may be necessary to drain properly. Support of the condensation line may be necessary to avoid blockage of the condensate flow.

11. Spark ignition

The burner flame is ignited by applying a high voltage to the system spark electrode. This causes a spark from electrode to ground.

12. The Vision 1 System

The Vision I System will allow the installing contractor to take the highly efficient modulating Munchkin and make it even more efficient by controlling the temperature delivered to the central heating circuits based on the outside temperature. The Vision I system is also a two temperature system, one temperature for central heating and the other temperature to the Super Stor Ultra Indirect water heater. This allows the user to increase the temperature supplied to the Super Stor Ultra indirect water heater to get a fast recovery by prioritizing the flow at a higher temperature than may be needed for the central heating circuits (this will require two separate circulators). You must follow the piping, wiring and programming instructions located in the Vision One section of this manual. The Vision 1 kit consists of the following, which is included with your equipment

- Outdoor sensor – 7250P-319
- Indirect tank sensor – 7250P-325

PART 3: PREPARE BOILER LOCATION

A. BOILER LOCATION SHOULD BE LEVEL

⚠️ CAUTION

When preparing the boiler location, make sure the area where you are placing the boiler is level. In order for the condensate to flow to the location of the condensate hose, the boiler must be slightly pitched back to assure proper flow direction. The Munchkin Boiler comes equipped with leveling feet. Should you find the floor beneath the boiler is uneven, with a wrench, adjust the leveling feet so the boiler is pitched back at 1/8” per foot.

Figure 2-3
PART 3: PREPARE BOILER LOCATION (CONTINUED)

B. INSTALLATIONS MUST COMPLY WITH:

- Local, state, provincial, and national codes, laws, regulations and ordinances.
- Standard for Controls and Safety Devices for Automatically Fired Boilers, ANSI/ASME CSD-1, when required.
- National Electrical Code.
- For Canada only: B149.1 or B149.2 Installation Code, CSA C22.1 Canadian Electrical Code Part 1 and any local codes.

C. BEFORE LOCATING THE BOILER

1. Check for nearby connection to:
   - System water piping
   - Venting connections
   - Gas supply piping
   - Electrical power

2. Check area around boiler. Remove any combustible materials, gasoline and other flammable liquids.

   **WARNING**

   Failure to keep boiler area clear and free of combustible materials, gasoline and other flammable liquids and vapors can result in severe personal injury, death or substantial property damage.

3. The Munchkin gas control system components are protected from dripping or spraying water.
or rain during operation or service.

4. If the Munchkin Boiler is to replace an existing boiler, check for and correct any existing system problems such as:
   - System leaks.
   - Incorrectly-sized expansion tank.
   - Lack of freeze protection in boiler water causing system and boiler to freeze and leak.
   - Excessive glycol which will affect the boiler system operation.

**D. CLEARANCES FOR SERVICE ACCESS**

1. See Figure 3-1 for recommended service clearances. If you do not provide minimum clearances shown, it might not be possible to service the boiler without removing it from the space.

**WARNING**

The space must be provided with combustion/ventilation air openings correctly sized for all other appliances located in the same space as the Munchkin boiler. The boiler cover must be securely fastened to the boiler to prevent boiler from drawing air from inside the boiler room. This is particularly important if the boiler is located in the same room as other appliances. Failure to comply with the above warnings could result in severe personal injury, death or substantial property damage.

**E. RESIDENTIAL GARAGE INSTALLATION**

**Precautions**

Take the following special precautions when installing the boiler in a residential garage. If the boiler is located in a residential garage, per ANSI Z223.1, paragraph 5.1.9:

- Mount the boiler with a minimum of 18 inches above the floor of the garage to the bottom of the boiler to ensure the burner and ignition devices will be no less than 18 inches above the floor.
- Locate or protect the boiler so it cannot be damaged by a moving vehicle.

**F. EXHAUST VENT AND INTAKE AIR VENT**

The Munchkin Boiler requires a special vent system, designed for pressurized venting. Munchkin Boilers are rated ANSI Z21.13 Category IV (pressurized vent, likely to condense in the vent).

You must also install air intake piping from outside to the boiler flue adaptor. The resultant installation is categorized as direct vent (sealed combustion). **Note: To prevent combustion air contamination see Table 3-2 in this section when considering exhaust vent and intake air vent termination.**

Intake and exhaust must terminate near each other and may be vented vertically through the roof or out a side wall. The intake and exhaust venting methods are detailed in the Venting Section. Do not attempt to install the Munchkin Boiler using any other means. Be sure to locate the boiler such that the air intake and exhaust...
vent piping can be routed through the building and properly terminated. The air intake and exhaust vent piping lengths, routing and termination method must all comply with the methods and limits given in the Venting section.

G. PREVENT COMBUSTION AIR CONTAMINATION

Install intake air piping for the Munchkin Boiler as described in the Venting section. Do not terminate exhaust in locations that can allow contamination of intake air.

H. WHEN REMOVING A BOILER FROM AN EXISTING COMMON VENT SYSTEM

DANGER

Do not install the Munchkin Boiler into a common vent with any other appliance. This will cause flue gas spillage or appliance malfunction, resulting in possible severe personal injury, death or substantial property damage.

WARNING

Failure to follow all instructions can result in flue gas spillage and carbon monoxide emissions, causing severe personal injury or death.

At the time of removal of an existing boiler, the following steps shall be followed with each appliance remaining connected to the common venting system placed in operation, while the other appliances remaining connected to the common venting system are not in operation.

a. Seal any unused openings in the common venting system.

b. Visually inspect the venting system for proper size and horizontal pitch and determine there is non blockage or restriction, leakage, corrosion and other deficiencies which could cause an unsafe condition.

c. Insofar as is practical, close all building doors and windows and all doors between the space in which the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any appliance not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.

d. Place in operation the appliance being inspected. Follow the lighting instructions. Adjust thermostat so appliance will operate continuously.

e. Test for spillage at draft hood opening after 5
PART 3: PREPARE BOILER LOCATION (CONTINUED)

minutes of main burner operation. Use the flame of a match or candle, or smoke from a cigarette, cigar, or pipe.

f. After it has been determined that each appliance remaining connected to the common venting system properly vents when tested as outlined herein, return doors, windows, exhaust fans, fireplace dampers, and any other gas-burning appliance to their previous conditions of use.

g. Any improper operation of common venting system should be corrected so the installation conforms with the National Fuel Gas Code, ANSI Z223.1 — latest edition. Correct by resizing to approach the minimum size as determined using the appropriate tables in Table 13 of NFPA54 ANSI Z223.1 2006 of that code. Canadian installations must comply with B149.1 or B149.2 Installation Code.

PART 4: PREPARE BOILER

A. REMOVE BOILER FROM BOX

1. Prior to installing, care must be taken to place boiler in a safe location prior to installation on the wall to prevent damage to the mechanical connections.

PART 5: BOILER PIPING

A. RELIEF VALVE

Connect discharge piping to safe disposal location, following guidelines in the WARNING below.

WARNING

To avoid water damage or scalding due to relief valve operation:

- Discharge line must be connected to relief valve outlet and run to a safe place of disposal. Terminate the discharge line in a manner that will prevent possibility of severe burns or property damage should the valve discharge.
- Discharge line must be as short as possible and be the same size as the valve discharge connection throughout its entire length.
- Discharge line must pitch downward from the valve and terminate at least 6" above the floor drain where any discharge will be clearly visible.
- The discharge line shall terminate plain, not threaded, with a material serviceable for temperatures of 375 °F or greater.
- Do not pipe the discharge to any place where freezing could occur.
- No shutoff valve shall be installed between the relief valve and boiler, or in the discharge line. Do not plug or place any obstruction in the discharge line.
- Test the operation of the valve after filling and pressurizing system by lifting the lever. Make sure the valve discharges freely. If the valve fails to operate correctly, replace it with a new relief valve.
- Failure to comply with the above guidelines could result in failure of the relief valve to operate, resulting in possibility of severe personal injury, death or substantial property damage.
B. GENERAL PIPING INFORMATION

NOTICE

The Munchkin Boiler control module uses temperature sensors to provide both high limit protection and modulating temperature control. The control module also provides low water protection by sensing the water pressure of the heat exchanger. Some codes/jurisdictions may require additional external controls for high limit and/or low water cutoff protection.

C. SEPARATE LOW WATER CUTOFF

A low water cutoff may be required by state local code or some insurance companies. Check code requirements before installation of the Munchkin Boiler. It is also required that a low water cutoff be used if the boiler is installed above the piping level.

If required:
- Use a low water cutoff designed for hydronic installations that is an electrode probe type
- Install in a tee on the supply piping above the boiler
- Follow low water cutoff manufacturer’s instructions

D. BACKFLOW PREVENTER

Use a backflow preventer specifically designed for hydronic boiler installations. This valve should be installed on the cold water fill supply line per local codes. (See piping details at the end of this section.)

CAUTION

Undersized expansion tanks cause system water to be lost from relief valve and makeup water to be added through fill valve. Eventual boiler failure can result due to excessive make-up water addition.

2. Expansion tank must be located as shown in Boiler Piping Part 5, or following recognized design methods. See tank manufacturer’s instructions for details.

3. Connect the expansion tank to the air separator only if the separator is on the suction side of the circulator. Always install the system fill connection at the same point as the expansion tank connection to the system.

4. Most chilled water systems are piped using a closed type expansion tank.

Diaphragm (or bladder) expansion tank

1. Always install an automatic air vent on top of the air separator to remove residual air from the system.

F. CIRCULATORS

CAUTION

DO NOT install automatic air vents on closed-type expansion tank systems. Air must remain in the system and return to the tank to provide its air cushion. An automatic air vent would cause air to leave system, resulting in water-logging the expansion tank.

CAUTION

DO NOT use the boiler circulator in any location other than the ones shown in this manual. The boiler circulator is selected to ensure adequate flow through the Munchkin Boiler. Failure to comply could result in unreliable performance and nuisance shut downs from insufficient flow.

E. SYSTEM WATER PIPING METHODS

Expansion tank and make-up water

1. Ensure expansion tank size will handle boiler and system water volume and temperature. Allow 3 gallons for boiler and its piping and 4 gallons for the 399.

Sizing space heat system piping

1. See Piping Details in this manual Part 5. In all
diagrams, the space heating system is isolated from the boiler loop by the primary/secondary connection.

2. Size the piping and components in the space heating system using recognized design methods.

G. HYDRONIC PIPING WITH CIRCULATORS, ZONE VALVES AND MULTIPLE BOILERS

The Munchkin Boiler is designed to function in a closed loop 15 PSI System. A factory installed water pressure switch will ensure that you have adequate pressure in the system. The Munchkin Boiler will not operate without a minimum of 10 PSI water pressure. This assures you that if the system does have leak, the Munchkin Boiler will lock out (PRO on the display) before it damages the Stainless Steel Heat Exchanger. We have also included a Temperature and Pressure gauge which allows the user to monitor the system pressure and outlet temperature from the Munchkin Boiler. It is important to note that the Munchkin Boiler has a minimal amount of pressure drop and must be calculated when sizing the circulators. Each Munchkin Boiler installation must have an Air Elimination device that will remove air from the system. Install the Munchkin Boiler so the gas ignition system components are protected from water (dripping, spraying, etc.) allowing clearance for basic service of circulator replacement, valves and other. Observe minimum 1” clearance around all un-insulated hot water pipes when openings around pipes are not protected by non-combustible materials. On a Munchkin Boiler installed above radiation level, some states and local codes require a low water cut off device at the time of installation (See Part C this section). If the Munchkin Boiler supplies hot water to heating coils in air handler units, flow control valves or other devices must be installed to prevent gravity circulation of heater water in the coils during the cooling cycle. Chilled Water Medium must be piped in parallel with the heater. Freeze Protection for new or existing systems must use glycol that is specifically formulated for this purpose. It will include inhibitors that will prevent the glycol from attacking the metallic system components. Make certain that the system fluid is checked for the correct glycol concentration and inhibitor level. The system should be tested at least once a year and as recommend by the producer of the glycol solution. Allowance should be made for the expansion of the glycol solution in the system piping. Example 50% by volume solution expands 4.8% in volume for the temperature increase from 32 F to 180 F, while water expands 3% with the same temperature rise.

Basic steps are listed below, with Illustration, which will guide you through the installation of the Munchkin.

1. Connect the system return marked “Heater In”.
2. Connect the system supply marked “Heater Out”.
3. Install Purge and Balance Valve or shut off valve and drain on system return to purge air out of each zone.
4. Install a Back Flow preventor on the Cold Feed Make-Up Water line.
5. Install a Pressure Reducing Valve on the Cold Feed Make-Up Water line, (15 PSI nominal on the system return). Check Temperature and Pressure Gauge which should read minimum pressure of 12 PSI.
6. Install a circulator as shown in piping details (this section). Make sure the circulator is properly sized for the system and friction loss.
7. Install an Expansion Tank on the system supply. Consult the tank manufacturer’s instruction for specific information relating to expansion tank installation. Size the expansion tank for the required system volume and capacity.
8. Install an Air Elimination Device on the system supply.
9. Install a drain valve at the lowest point of the system. Note: The Munchkin Boiler can not be drained completely of water without purging the unit with an air pressure 15 PSI.
10. The Safety Relief Valve is installed at the factory. Pipe the discharge of the safety relief valve to prevent injury in the event of pressure relief. Pipe the discharge 6" above the drain to a drain. Provide piping that is the same size as the safety relief valve outlet. **Never block the outlet of safety relief valve.**

**H. CIRCULATOR SIZING**

The Munchkin Boiler Heat Exchanger does have pressure drop which must be considered in your system design. Refer to the graph in Fig. 5-1 below for pressure drop through the Munchkin Boiler Heat Exchanger for recommended pump selection at a 20∆t design.

---

Note: SuperStor Ultra Indirect pump assumes the following: (6) 90 degree elbows and (1) tee on the run of 20' and 1" of copper tube size, but does not include any flow checks or zone valves.

*See drawings on the following pages
I. FILL AND PURGE HEATING SYSTEM

- Attach the hose to balance and purge hose connector or drain valve and run hose to nearest drain.
- Close the other side of the balance and purge valve or the shut off valve after the drain.
- Open first zone balance and purge or drain valve to let water flow out the hose. If zone valves are used, open the valves one at a time manually. (Note: You should check valve manufacturer’s instruction prior to opening valves manually, so as not to damage the valve.)
- Manually operate fill valve regulator. When water runs out of the hose, while it’s connected to the balance and purge valve or drain you will see a steady stream of water (without bubbles). Close balance and purge valve or drain to stop the water from flowing. Disconnect the hose and connect it to next zone to be purged.
- Repeat this procedure for additional zones (one at a time).

Upon completion, make sure that the fill valve is in automatic position and each zone balance and purge or shut off is in an open position and zone valves are positioned for automatic operation.

**WARNING**

Use only inhibited propylene glycol solutions which are specially formulated for hydronic systems. Ethylene glycol is toxic and can attack gaskets and seals used in hydronic systems. Glycol mixtures should not exceed 50%.

1. Glycol in hydronic applications which is specially formulated for this purpose includes inhibitors that prevent the glycol from attacking metallic system components. Make certain that the system fluid is checked for the correct glycol concentration and inhibitor level.
2. The glycol solution should be tested at least once a year and as recommended by the glycol manufacturer.
3. Anti-freeze solutions expand more than water. For example a 50% by volume solution expands 4.8% in volume for a temperature increase from 32° F to 180° F, while water expands 3% with the same temperature rise. Allowances must be made for this expansion in the system design.
4. A 30% mixture of glycol will result in a BTU output loss of 15% with a 5% increase in head against system circulator.
5. A 50% mixture of glycol will result in a BTU output loss of 30% with a 50% increase in head against system circulator.

---

**CAUTION**

For installation that incorporates standing Iron Radiation and systems with manual vents at the high points. Follow above section and starting with the nearest manual air vent, open vent until water flows out, then close vent. Repeat procedure, working your way toward furthest air vent. It may be necessary to install a basket strainer in an older system where larger amounts of sediment may be present. Annual cleaning of the strainer may be necessary.

---

The chart below represents the various system temperatures, their respective flows and friction loss through the Munchkin which will aid in circulator selection.

N/R = Not Recommended  
N/A = Not Available
PART 5: BOILER PIPING (CONTINUED)

CAUTION

It is highly recommended that you carefully follow the glycol manufacturer’s recommended concentrations, expansion requirements and maintenance recommendations (pH additive breakdown, inhibitor reduction, etc.). You must carefully figure the additional friction loss in the system as well as the reduction in heat transfer co-efficients.

J. ZONING WITH ZONE VALVES

1. Connect boiler to system as shown in 2A and 2B in Piping Details when zoning with zone valves. The primary/secondary piping shown ensures the boiler loop will have sufficient flow. It also avoids applying the high head of the boiler circulator to the zone valves.

2. Connect DHW (domestic hot water) piping to indirect storage water heater as shown.

K. ZONING WITH CIRCULATORS

1. Connect boiler to system when circulator zoning as shown in 1C and 1D in Piping Details when zoning with circulators. The boiler circulator cannot be used for a zone. It must supply only the boiler loop.

2. Install a separate circulator for each zone.

3. Connect DHW (domestic hot water) piping to indirect storage water heater as shown.

L. MULTIPLE BOILERS

1. Connect multiple boilers as shown in 1E and 1F in Piping Details.

2. All piping shown is reverse return to assure balanced flow through the connected boilers.

3. Each connected boiler must have its own circulator pump to assure adequate flow.

4. Connect DHW (domestic hot water) piping to indirect storage water heater as shown.

CAUTION

It is highly recommended that you carefully follow the glycol manufacturer’s recommended concentrations, expansion requirements and maintenance recommendations (pH additive breakdown, inhibitor reduction, etc.). You must carefully figure the additional friction loss in the system as well as the reduction in heat transfer co-efficients.

Standard Munchkin boiler
Preferred piping (zoning with valves)
Space heating mode

NOTES:
1. This drawing is meant to show system piping concept only.
   Installer is responsible for all equipment & detailing required by local codes.
2. Adjust differential pressure bypass valve to eliminate any flow velocity noise when zone with highest pressure drop operates by itself.
3. The minimum pipe size for connecting a Super Stor water heater is 1 inch.
4. The minimum pipe size for connecting a Munchkin boiler is 1.25 inches and 2 inches for the 399M.
5. All pumps are shown with isolation flanges. The alternative is standard flanges with full port ball valves.
6. The anti-scald mixing valve is recommended if the DHW temperature is set above the factory setting of 119°F.
7. Install a minimum of 12 diameters of straight pipe upstream of all circulators.
8. A purging valve may be used in lieu of the ball valve / hose bib combination shown.
9. A minimum of 6 pipe diameters of straight pipe shall be installed upstream and downstream of all closely spaced tees.

NOTE: For Vision piping applications, refer to the Vision Installation Piping Diagrams.

PART 6. BOILER PIPING WITH VISION I SYSTEM (DHW PRIORITY WITH OUTDOOR RESET)

A. VISION I SYSTEM PIPING

It is important that the system piping is done correctly when using the Vision 1 System. Follow the piping diagrams 2A through 3G when piping your Munchkin Boiler with Vision I. All general piping practices should still be maintained.

B. ZONING WITH ZONE VALVES USING VISION I

1. Connect the boiler to the system as shown in piping details 3A through 3C.

2. Connect the DHW circulator (P2) directly to the boiler as shown in piping details. The boiler circulator (P1) will shut down when there is a DHW demand.

C. ZONING WITH CIRCULATORS USING VISION I

1. Connect the boiler to the system as shown in piping details 4A through 4G.

2. Connect the DHW circulator (P2) directly to the boiler as shown in piping details. The boiler circulator (P1) will shut down when there is a DHW demand.

6. All pumps are shown with isolation flanges and integral flow check valves.
   The alternative is standard flanges with full port ball valves and a separate flow check valve.
7. The anti-scald mixing valve is recommended if the DHW temperature is set above the factory setting of 119˚F.
8. Follow all instructions for installation of injection mixing system.
9. A purging valve may be used in lieu of the ball valve / hose bib combination shown.
10. Adjust 3-way manually-set mixing valve to yield proper supply temperature to lower temperature load.
Munchkin VISION 1 system

Multiple high temperature priority loads controlled with zone valves

NOTES:

1. This drawing is meant to show system piping concept only.
2. Installer is responsible for all equipment & detailing required by local codes.
3. All closely spaced tees shall be within 4 pipe diameter center to center spacing.
4. A minimum of 6 pipe diameters of straight pipe shall be installed upstream and downstream of all closely spaced tees.
5. The minimum pipe size for connecting a Super Stor water heater is 1 inch.
6. The minimum pipe size for connecting a Munchkin boiler shall be 1.25 inches and 2 inches for the 399M.
7. All pumps are shown with isolation flanges and integral flow check valves. The alternative is standard flanges with full port ball valves and a separate flow check valve.
8. The anti-scald mixing valve is recommended if the DHW temperature is set above the factory setting of 119°F.
9. Install a minimum of 12 diameters of straight pipe upstream of all circulators.
10. A purging valve may be used in lieu of the ball valve / hose bib combination shown.
11. High temperature loads cannot operate simultaneously with low temperature loads.
12. Domestic water heating is highest priority load, and controlled through priority zone of multi-zone relay center.
Munchkin VISION 1 system
Multiple high temperature priority loads
controlled with zone circulators
Multiple low temperature load controls with zone circulators

NOTES:
1. This drawing is meant to show system piping concept only.
2. Installer is responsible for all equipment & detailing required by local codes.
3. All closely spaced tees shall be within 4 pipe diameter center to center spacing.
4. The minimum pipe size for connecting a Super Stor water heater is 1 inch.
5. The minimum pipe size for connecting a Munchkin boiler shall be 1.25 inches and 2 inches for the 399M.
6. All pumps are shown with isolation flanges and integral flow check valves.
   The alternative is standard flanges with full port ball valves and a separate flow check valve.
7. The anti-scald mixing valve is recommended if the DHW temperature is set above the factory setting of 119˚F.
8. Install a minimum of 12 diameters of straight pipe upstream of all circulators.
9. A purging valve may be used in lieu of the ball valve / hose bib combination shown.
10. High temperature loads cannot operate simultaneously with low temperature loads.
11. Supply water temperature to high temperature loads is not reset based on outdoor temperature.
12. Domestic water heating is highest priority load, and controlled through priority zone of multi-zone relay center.
PART 7: VENTING, COMBUSTION AIR & CONDENSATE REMOVAL

DANGER
Munchkin Boiler must be vented as detailed in Venting section Part 7. Ensure the exhaust and intake piping comply with these instructions regarding vent system. Inspect finished combustion air intake and exhaust piping thoroughly to ensure all joints are well secured and airtight and comply with all applicable code requirements, as well as with the instructions provided in this manual. Failure to provide a properly installed vent system will cause severe personal injury or death.

A. INSTALLING EXHAUST VENT AND INTAKE AIR VENT

WARNING
This vent system will operate with a positive pressure in the pipe. Do not connect vent connectors serving appliances vented by natural draft into any portion of mechanical draft systems operating under positive pressure. Follow the venting instructions below carefully. Failure to do so may result in severe personal injury, death, or substantial property damage.

B. GENERAL

1. Install the boiler venting system in accordance with these instructions and with the National Fuel Gas Code, ANSI Z223.1/NFPA 54, CAN/CGA B149, and/or applicable provisions of local building codes.

2. This boiler is a direct vent appliance and is listed as a Category IV appliance with Underwriters Laboratories, Inc. VENT AND INTAKE AIR PIPE

C. APPROVED MATERIALS FOR EXHAUST VENT AND INTAKE AIR VENT

1. Use only Non Foam Core venting material. The following materials are approved for use as vent pipe for this boiler:
   
a. Non Foam Core PVC (Polyvinyl Chloride) Pipe conforming to ASTM D-1785.
   
b. Non Foam Core CPVC (Chlorinated Polyvinyl Chloride) Pipe conforming to ASTM D-1785.
   

WARNING
Do not use Foam Core Pipe in any portion of the exhaust piping from this boiler. Use of Foam Core Pipe may result in severe personal injury, death, or substantial property damage.

2. Cellular foam core piping may be used on air inlet piping only. Never use cellular foam core material for exhaust vent piping.

D. EXHAUST VENT AND INTAKE AIR VENT PIPE LOCATION

WARNING
Both exhaust and intake air vents must exit from the same side of the building to assure correct appliance operation.

1. Determine exhaust vent location:
   
a. The vent piping for this boiler is approved for zero clearance to combustible construction.
   
b. See illustration within this section of clearances for location of exit terminals of direct-vent venting systems.
   
c. This boiler vent system shall terminate at least 3 feet (0.9 m) above any forced air intake located within 10 ft (3 m). Note: this does not apply to the combustion air intake of a direct-vent appliance.
   
d. Provide a minimum of 1 foot distance from any door, operable window, or gravity intake into any building.

   e. Provide a minimum of 1 foot clearance from the bottom of the exhaust above the expected snow accumulation level. Snow removal may be necessary to maintain clearance.
f. Provide 4 feet horizontal clearance from electrical meters, gas meters, gas regulators and relief equipment. In no case shall the exit terminal be above or below the aforementioned equipment unless the 4 foot horizontal distance is maintained.

g. Do not locate the exhaust over public walkways where condensate could drip and/or freeze and create a nuisance or hazard.

h. When adjacent to a public walkway, locate exit terminal at least 7 feet above grade.

i. Do not locate the exhaust directly under roof overhangs to prevent icicles from forming.

j. Provide 4 feet clearance from the inside corner of vertical walls, chimneys, etc., as well as horizontal corners created by roof overhangs.

2. Determine air intake vent location.

   a. Provide 1 foot clearance from the bottom of the intake air vent and the level of maximum snow accumulation. Snow removal may be necessary to maintain clearances.

   b. Do not locate intake air vent in a parking area where machinery may damage the pipe.

   c. When venting with a two pipe system, maximum distance between intake air vent and exhaust vent is 6 feet (1.8 m). Minimum distance between exhaust vent and intake air vent on single boiler is 8” (0.2 m) center-to-center. Minimum distance between exhaust vents and intake air vents on multiple boilers is 8” (0.2 m) center-to-center.
Location of exit terminals of mechanical draft and direct-vent venting systems.

**Fig. 7-1**

**Fig. 7-2** Multiple Vent Spacing*
*Note: Exhaust must extend out 1 foot

**Fig. 7-3** Multiple Stainless Steel Horizontal Vent Kit Installation – Front View

**Figure 7-4** Multiple Boiler Installations
E. EXHAUST VENT AND INTAKE AIR VENT SIZING

1. The exhaust vent and intake air vent pipes should be 2" for the T50/T80, 3" for the 80M/140M/199M and 4" for the 399M.

2. The total combined equivalent length of exhaust vent and intake air pipe should not exceed 85 feet.
   a. The equivalent length of elbows, tees, and other fittings are listed in the Friction Loss Table 7.5.

   *Friction loss for long radius elbow is 1 foot less.

   b. For example: If the exhaust vent has two 90° elbows and 10 feet of PVC pipe we will calculate:

   Exhaust Vent Pipe Equivalent Length = (2x5) + 10 = 20 feet

   Further, if the intake air vent pipe has two 90° elbows, one 45° elbow and 10 feet of PVC pipe, the following calculation applies:

   Intake Air Vent Pipe Equivalent Length = (2x5) + 3 +10 = 23 feet

   Finally, if a concentric vent kit is used we find:

   Total Combined Equivalent Length = 20 + 23 + 3 = 46 feet

   Therefore, the total combined equivalent length is 46 feet which is well below the maximum of 85 feet.

   c. The intake air vent pipe and the exhaust vent are intended to penetrate the same wall or roof of the building.

   d. Effort should be made to keep a minimum difference in equivalent length between the intake air vent pipe and the exhaust vent.

   3. The minimum combined equivalent length is 16 equivalent feet.

F. LONGER VENT RUNS

1. The maximum combined equivalent length can be extended by increasing the diameter of both exhaust vent and intake air vent pipe equally. However, the transitions should begin a minimum of 15 equivalent feet from the boiler.

   a. The maximum equivalent length for the increased diameter vent pipes is 125 feet.

   b. Transitions should always be made in vertical sections of pipe to prevent the condensate from pooling in the vent pipe.

   c. If the transition occurs at a distance greater than 15 equivalent feet from the boiler, the maximum equivalent length will be reduced. See Table 7.7.

G. EXHAUST VENT AND INTAKE AIR PIPE INSTALLATION

1. Use only solid PVC, CPVC, or ABS schedule
40 or 80 pipe. FOAM CORE PIPING IS NOT APPROVED.

2. Remove all burrs and debris from joints and fittings.

3. All joints must be properly cleaned, primed, and cemented. Use only cement and primer approved for use with the pipe material. Cement must conform to ASTM D2564 for PVC or CPVC pipe and ASTM D2235 for ABS pipe.

4. Horizontal lengths of exhaust vent must slope back towards the boiler not less than ¼" per foot to allow condensate to drain from the vent pipe. If the exhaust pipe must be piped around an obstacle that results in the creation of a low point, condensate will collect in this low point and form a blockage. This condensate must be drained away using a field-installed condensate drain assembly as shown.

5. All piping must be fully supported. Use pipe hangers at a minimum of 4 foot intervals to prevent sagging of the pipe where condensate may form.

6. Do not use the boiler to support any piping.

7. A screened straight coupling is provided with the boiler for use as an outside exhaust termination.

8. A screened inlet air tee is provided with the boiler to be used as an outside intake termination.

9. The following information on Table 7.7 are optional intake air/exhaust vent terminations available from Heat Transfer Products, Inc.

G. HEATER REMOVAL FROM A COMMON VENT SYSTEM

At the time of removal of an existing heater, the following steps shall be followed with each appliance remaining connected to the common venting system placed in operation, while the other appliances remaining connected to common venting system are not operating.

1. Seal any unused openings in the common venting system.

2. Visually inspect the venting system for proper size and horizontal pitch to determine if there is blockage, leakage, corrosion or other deficiencies that could cause an unsafe condition.

3. If practical, close all building doors, windows and all doors between the space in which the appliance remains connected to the common venting system located and other spaces in the building. Turn on clothes dryers and any appliances not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, at maximum speed. Do not operate a summer exhaust fan. Close all fireplace dampers.

4. Place in operation the appliance being inspected. Follow the lighting instructions. Adjust the thermostat so the appliance will operate continuously.

5. Test for spillage at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle or smoke from a cigarette.

6. After it has been determined that each appliance remaining connected to common venting system properly vents when tested as outlined, return doors, windows, exhaust fans, fireplace dampers and any other gas burning appliance to their previous condition of use.

7. Any improper operation of the common venting system should be corrected so the installation conforms with the National Fuel Gas Code, ANSI Z223.1. When resizing any portion of the common venting system, the common venting system should be resized to approach the minimum size as determined using the appropriate tables in Appendix G in the National Fuel Gas Code, ANSI Z 223.1.
I. CONDENSATE REMOVAL SYSTEM

This is a condensing high efficiency appliance, therefore this unit has a condensate removal system. Condensate is nothing more than water vapor, derived from the combustion products, similar to an automobile when it is initially started. It is very important that the condensate line is sloped away from the boiler and down to a suitable inside drain, if the condensate outlet on the Munchkin Boiler is lower than the drain, you must use a condensate removal pump (kit P/N 554200 available from Heat Transfer Products, Inc.) A condensate filter, if required by local authorities can be made up of lime crystals, marble or phosphate chips will neutralize the condensate. This can be done in the field by the installer or you may purchase one from Heat Transfer Products, Inc. (P/N N1100) It is also very important that the condensate line is not exposed to freezing temperatures, or any other type of blockage. Plastic tubing must be the only material used for the condensate line. Steel, brass, copper or others will be subject to corrosion or deterioration. A second vent may be necessary to prevent condensate line vacuum lock if a long horizontal run is used. Also, an increase in pipe size may be necessary to drain properly. Support of the condensation line may be necessary to avoid blockage of the condensate flow.

CAUTION

The condensate line must remain unobstructed, allowing free flow of condensate. If condensate is allowed to freeze in the line or if the line is obstructed in any other manor, condensate can exit from the boiler tee, resulting in potential water damage to property.

NOTICE

Use materials approved by the authority having jurisdiction. In the absence of other authority, PVC and CPVC pipe must comply with ASTM D1785, F441 or D2665. Cement and primer must comply with ASTM D2564 or F493. For Canada, use CSA or ULC certified PVC or CPVC pipe, fittings and cement.

When installing a condensate pump, select one approved for use with condensing boilers and furnaces. The pump should have an overflow switch to prevent property damage from condensate spillage.

Condensate from the Munchkin Boiler will be slightly acidic (typically with a pH from 3.2 to 4.5). Install a neutralizing filter if required by local codes.
GENERAL NOTE: All vent pipes must be glued, properly supported and the exhaust must be pitched a minimum of a ¼" per foot back to the heater (to allow drainage of condensate).

NOTE: When placing support brackets on vent piping, the first bracket must be within 1 foot of the appliance and the balance at 4 foot intervals on the vent pipe. The boiler venting must be readily accessible for visual inspection for the first three feet from the boiler.
NOTE: When placing support brackets on vent piping, the first bracket must be within 1 foot of the appliance and the balance at 4 foot intervals on the vent pipe. The boiler venting must be readily accessible for visual inspection for the first three feet from the boiler.

GENERAL NOTE: All vent pipes must be glued, properly supported and the exhaust must be pitched a minimum of a ¼" per foot back to the heater (to allow drainage of condensate).
NOTE: When placing support brackets on vent piping, the first bracket must be within 1 foot of the appliance and the balance at 4 foot intervals on the vent pipe. The boiler venting must be readily accessible for visual inspection for the first three feet from the boiler.

GENERAL NOTE: All vent pipes must be glued, properly supported and the exhaust must be pitched a minimum of a \( \frac{1}{4} \)" per foot back to the heater (to allow drainage of condensate).
PART 8: GAS PIPING

A. GAS CONNECTION

The gas supply shall have a maximum inlet pressure of less than 14" water column (350 mm), ½ pound pressure (3.5 kPa), and a minimum of 3.5" water column. The entire piping system, gas meter and regulator must be sized properly to prevent pressure drop greater than 0.5" as stated in the National Fuel Gas Code. This information is listed on the rating plate.

The nipple provided is ½" with a factory installed ¾" bell reducer. Do not remove this ¾" x ½" bell reducer! It is mandatory that this fitting is used for connection to a field fabricated drip leg as shown in the illustration above per the National Fuel Gas Code. You must ensure that the entire gas line to the connection at the Munchkin is no smaller than ¾". Once all the inspections have been performed, the piping must be leak tested. If the leak test requirement is a higher test pressure than the maximum inlet pressure, you must isolate the Munchkin from the gas line. In order to do this, you must shut the gas off using factory and field-installed gas cocks. This will prevent high pressure. Failure to do so may damage the gas valve. In the event the gas valve is exposed to a pressure greater than ½ PSI, 14" water column, the gas valve must be replaced. Never use an open flame (match, lighter, etc.) to check gas connections.

B. GAS PIPING

1. Run the gas supply line in accordance with all applicable codes.
2. Locate and install manual shutoff valves in

C. GAS TABLE

Refer to Table 8.1 to size the supply piping to minimize pressure drop between meter or regulator and unit.

Maximum Capacity of Pipe in Cubic Feet of Gas per Hour for Gas Pressures of 0.5 psi or Less and a Pressure Drop of 0.3 Inch water Column

</tbody>
</table>

It is recommended that a soapy solution be used to detect leaks. Bubbles will appear on the pipe to indicate a leak is present. The gas piping must be sized for the proper flow and length of pipe, to avoid pressure drop. Both the gas meter and the gas regulator must be properly sized for the total gas load. If you experience a pressure drop greater than 1" WC, the meter, regulator or gas line is undersized or in need of service. You can attach a manometer to the incoming gas drip leg, by removing the cap and installing the manometer. The gas pressure must remain between 3.5" and 14" during stand-by (static) mode and while in operating (dynamic) mode. If an in-line regulator is used, it must be a minimum of 10 feet from the Munchkin. It is very important that the gas line is properly purged by the gas supplier or utility. Failure to properly purge the lines or improper line sizing, will result in ignition failure. This problem is especially noticeable in NEW LP installations and also in empty tank situations. This can also occur when a utility company shuts off
service to an area to provide maintenance to their lines. This gas valve must not be replaced with a conventional gas valve under any circumstances.

As an additional safety feature, this gas valve has a flanged connection to the swirl plate and blower.

**D. DUNGS GAS VALVE FOR T50/T80/80M/140M/199M**

**WARNING**

For gas conversions for a boiler already installed, you must turn off gas supply, turn off power and allow boiler to cool before proceeding. You must also completely test the boiler after conversion to verify performance as described under “Startup” section of this manual. See separate natural to propane conversion instructions for conversion of an existing boiler available from Heat Transfer Products. Failure to comply with the proper gas conversion instructions could result in severe personal injury, death or substantial property damage. Failure to follow all precautions could result in fire, explosion or death!
PART 9: FIELD WIRING

A. INSTALLATION MUST COMPLY WITH:

1. National Electrical Code and any other national, state, provincial or local codes or regulations.

2. In Canada, CSA C22.1 Canadian Electrical Code Part 1, and any local codes.

B. FIELD WIRING

The Munchkin Boiler box has a 24 volt terminal strip on the boiler cabinet and 120 volt terminal strip enclosed in the electrical box. Each terminal connection is clearly marked to assure correct installation.

C. LINE VOLTAGE WIRING

1. Connect 120 VAC power wiring to the line voltage terminal strip located inside the electric junction box, as shown in figure 9.5.

2. Wire the Boiler Primary Circulator (P1) to the terminal strip. See wiring diagram in this section.

D. THERMOSTAT

1. Connect room thermostat or end switch

2. Install thermostat on inside wall away from influences of drafts, hot or cold water pipes, lighting fixtures, television, sunrays or fireplaces.

3. Thermostat anticipator (if applicable):
   a. If connected directly to boiler, set for 0.1 amps.
   b. If connected to relays or other devices, set to match total electrical power requirements of connected devices. See specifications of the device and thermostat instructions for details.

E. KROM SCHRODER VALVE FOR 399M

WARNING: IF FOR ANY REASON THE THROTTLE NEEDS TO BE ADJUSTED, IT IS VERY IMPORTANT THAT A COMBUSTION ANALYZER BE USED TO ENSURE SAFE AND PROPER OPERATION. THE ADJUSTMENT COULD AFFECT THE CO/CO2 LEVELS. MAKE SURE THE LEVELS CORRESPOND TO THE COMBUSTION SETTING CHART FIG 12-1 IN PART 12

NOTICE

Wiring must be N.E.C. Class 1.
If original wiring as supplied with boiler must be replaced, use only TEW 105 °C wire or equivalent.
Boiler must be electrically grounded as required by National Electrical Code ANSI/NFPA 70 — latest edition.
Fig. 9-1
FIELD WIRING WITH ZONE CIRCULATORS

Additional Zones may be added as shown above

Fig. 9-2
TYPICAL ZONE RELAY PANEL WIRING

Fig. 9-3
3-ZONE WIRING

Fig. 9-4
SECONDARY SYSTEM CIRCULATOR WIRING
Fig. 9-5
**Outdoor Sensor Function** The user can program the desired supply temperature based on the heat transmitter (Baseboard, Radiant Floor, Air Handler) that will be used in the installation. Once the outdoor sensor (Light Green Wires) is connected to the control board, the water temperature of the boiler will adjust to run the boiler more efficiently and provide greater comfort to the living space.

**Connection Specification – Wire 22 AWG maximum to 100 feet or 18 AWG up to 150 feet. Length of wire run cannot exceed 150 feet.**

Outdoor Sensor is connected in the junction box on the Munchkin Boiler. Route wires from the Munchkin Boiler terminal strip to your outdoor sensor, which will allow the user to change the temperature going to the Central Heating loop automatically. Place the outdoor sensor preferably to the north or northwest or to the side which will be affected by changing weather conditions outside. NOTE: Do not locate the sensor in the direct sunlight.

**CAUTION**

The wire to outdoor sensor must not be laid closer than 6' to line voltage wiring (120/240 V) and must never be in the same conduit.

**Indirect Sensor Function**: The Maximum run time on priority function for the Super Stor Ultra Indirect Fired Water Heater is from 1-60 minutes. The water temperature can only be adjusted when using a sensor (not a mechanical control). Temperature adjustments are from 95 to 185 degrees, plus a differential 1-18 degrees (Note: It is recommend that you do not exceed 5 minutes on the DHW pump post purge cycle to avoid cooling down your DHW tank).

Indirect Sensor is connected to the main control on the Munchkin Boiler. Route wires from the terminal strip to the sensor or the mechanical control Honeywell Part # L4080b-1395 (Not included in Vision I Package) into the control well located in the front of the water heater. This will allow the installer to control the temperature of the indirect from the Munchkin Boiler and give the water heater priority over the Central Heating Circuit. Once the Water Heater is satisfied, the boiler will then switch back to the Central Heating Circuit only if there is a call for heat, otherwise the Munchkin Boiler will then shut down.

**Indirect Circulator (P2) Program function**: The indirect water heater circulator program function will automatically start when the water heater sensor reads a call for heat, the installer can also program the post purge function on the circulator. The Post purge circulator function ranges from 1-30 minutes.

Indirect Circulator (P2) is connected to the terminal strip on the Munchkin Boiler. Run the wire to the Super Stor Ultra Indirect circulating pump. The purple wire will be your neutral lead and the pink wire will be your hot. This will supply 120 volts to the water heater circulator directly.

**Fault Code Alarm Output** is connected to the main controller on the Munchkin Boiler. Route wire from the Munchkin Boiler controller to an external relay or an audible alarm. The red wire will be your hot lead supplying 120 volts. The neutral connection will be connected to the neutral on the incoming power to the Munchkin Boiler.

**CAUTION**

Do not tie neutrals or hot wire leads to any other wires, go directly from the Munchkin Boiler controller to the circulator.

**Connection Specification – Wire 18 AWG maximum. Length of wire run cannot exceed 100 feet.**
PART 11. START-UP PREPARATION

A. CHECK/CONTROL WATER CHEMISTRY

**WARNING**

Do not use petroleum-based cleaning or sealing compounds in boiler system. Damage to elastomer seals and gaskets in system could occur, resulting in substantial property damage.

Water pH between 6.0 and 8.0

1. Maintain boiler water pH between 6.0 and 8.0. Check with litmus paper or have chemically analyzed by water treatment company.
2. If pH differs from above, consult local water treatment company for treatment needed.

Hardness less than 7 grains.

1. Consult local water treatment companies for unusually hard water areas (above 7 grains hardness).

Chlorine concentration less than 200 ppm

1. Filling with chlorinated fresh water should be acceptable since drinking water chlorine levels are typically less than 5 ppm.
2. Do not use the boiler to directly heat swimming pool or spa water.
3. Do not fill boiler or operate with water containing chlorine in excess of 200 ppm.

Clean system to remove sediment

1. You must thoroughly flush the system (without boiler connected) to remove sediment. The high-efficiency heat exchanger can be damaged by buildup or corrosion due to sediment.
2. For zoned systems, flush each zone separately through a purge valve. (If purge valves and isolation valves are not already installed, install them to properly clean the system.)
3. Flush system until water runs clean and you are sure piping is free of sediment.

Test/replace freeze protection fluid

1. For systems using freeze protection fluids, follow fluid manufacturer’s instructions to verify inhibitor level and that other fluid characteristics are satisfactory.
2. Freeze protection fluid must be replaced periodically due to degradation of inhibitors over time. Follow all fluid manufacturer’s instructions.

B. FREEZE PROTECTION (WHEN USED)

**WARNING**

NEVER use automotive or standard glycol antifreeze, even ethylene glycol made for hydronic systems. Use only freeze-prevention fluids certified by fluid manufacturer as suitable for use with stainless steel boilers, verified in fluid manufacturer’s literature.

Thoroughly clean and flush any system that has has used glycol before installing the new Boiler.

Provide boiler owner with a material safety data sheet (MSDS) on the fluid used.

1. Determine freeze protection fluid quantity using total system water content, following fluid manufacturer’s instructions. Remember to include expansion tank water content.
2. Local codes may require back flow preventer or actual disconnect from city water supply.
3. When using freeze protection fluid with automatic fill, install a water meter to monitor water makeup. Freeze protection fluid may leak before the water begins to leak, causing concentration to drop, reducing the freeze protection level.

C. FILL AND TEST WATER SYSTEM

1. Fill system only after ensuring the water meets the requirements of this manual.
2. Close manual and automatic air vents and boiler drain valve.
3. Fill to correct system pressure. Correct pressure will vary with each application.
   a. Typical cold water fill pressure for a residential system is 12 psi.
   b. Pressure will rise when boiler is turned on and system water temperature increases. Operating pressure must never exceed 25 psig.
4. At initial fill and during boiler startup and testing, check system thoroughly for any leaks. Repair all leaks before proceeding further.
PART 11. START-UP PREPARATION (CONTINUED)

**WARNING**

Eliminate all system leaks. Continual fresh make-up water will reduce boiler life. Minerals can build up in the heat exchanger, reducing heat transfer, overheating heat exchanger, and causing heat exchanger failure.

5. The system may have residual substances that could affect water chemistry. After the system has been filled and leak tested, verify water pH and chlorine concentrations are acceptable.

**CAUTION**

It is important that you purge the system of air to avoid damage to the boiler.

**D. PURGE AIR FROM WATER SYSTEM**

1. Purge air from system:
   a. Connect a hose to the purge valve and route hose to an area where water can drain and be seen.
   b. Close the boiler or system isolation valve between the purge valve and fill connection to the system.
   c. Close zone isolation valves.
   d. Open quick-fill valve on cold water make-up line.
   e. Open purge valve.
   f. One zone at a time, open the isolation valves. Allow water to run through the zone, pushing out the air. Run until no noticeable air flow is present. Close the zone isolation valves and proceed with the next zone. Follow this procedure until all zones are purged.
   g. Close the quick-fill water valve and purge valve and remove the hose. Open all isolation valves. Watch that system pressure rises to correct cold-fill pressure.
   h. After the system has operated for a while, eliminate any residual air by using the manual air vents located throughout the system.
   i. If purge valves are not installed in system, open manual air vents in system one at a time, beginning with lowest floor. Close vent when water squirts out. Repeat with remaining vents.
   j. Refill to correct pressure.

**E. CHECK FOR GAS LEAKS**

**WARNING**

Before starting the boiler, and during initial operation, smell near the floor and around the boiler for gas odorant or any unusual odor. Remove boiler front door and smell interior of boiler enclosure. Do not proceed with startup if there is any indication of a gas leak. Repair any leak at once.

**F. CHECK THERMOSTAT CIRCUIT(S)**

1. Disconnect the two external wires connected to the boiler thermostat terminals (low voltage terminal strip terminals 5 and 6).

2. Connect a voltmeter across these two incoming wires. Close each thermostat, zone valve and relay in the external circuit one at a time and check the voltmeter reading across the incoming wires.

3. There should NEVER be a voltage reading.

4. If a voltage does occur under any condition, check and correct the external wiring. (This is a common problem when using 3-wire zone valves.)

5. Once the external thermostat circuit wiring is checked and corrected if necessary, reconnect the external thermostat circuit wires to boiler low voltage terminal strip. Allow the boiler to cycle.
PART 11. START-UP PREPARATION (CONTINUED)

G. CHECK CONDENSATE REMOVAL

1. The Munchkin Boiler is a high efficiency condensing boiler, there, the unit has a condensation drain. Condensate is nothing more than water vapor, derived from combustion products, similar to an automobile when it is initially started. The condensation is slightly acidic (typically with pH of 3 to 5) and must be piped with the correct materials. Never pipe the condensate using steel, copper, brass or other materials that will be subject to corrosion. Plastic PVC or CPVC pipe are the only approved materials. A condensate filter, if required by local authorities, can be made up of lime crystals, marble or phosphate chips that will neutralize the condensate. This may be done by the installer or you may purchase a condensate neutralizer from Heat Transfer Products, Inc. (P/N N1100)

2. The Munchkin Boiler is equipped with a ¾ pipe connection that runs the condensation line to a local drain. It is very important that the condensate line is sloped away from the heater and down to a suitable inside drain. If the condensate outlet is lower than the drain, you must use a condensate removal pump, available at Heat Transfer Products (#554200). This pump is equipped with two leads that can be connected to an alarm or another type of warning device to alert residents of a condensate overflow, which, if not corrected, could cause property damage.

3. The Munchkin Boiler is equipped with an internal vent on the top plug connection to assure adequate flow of condensate. This vent should never be blocked.

4. If a long horizontal run is used, it may be necessary to create a second vent to prevent a vacuum lock in the condensate line. Do not expose the condensate to freezing temperatures.

5. Do not expose the condensate to freezing temperatures.

6. It is very important you support the condensation line to assure proper drainage.

H. FINAL CHECKS BEFORE STARTING BOILER

1. Read Startup Procedures within this manual for proper steps to start boiler. (See Startup Report to record steps for future reference.)

2. Verify the boiler and system are full of water and all system components are correctly set for operation.

3. Fill condensate trap with water.

4. Verify electrical connections are correct and securely attached.

5. Inspect intake piping and exhaust piping for signs of deterioration from corrosion, physical damage or sagging. Verify intake piping and exhaust piping are intact and correctly installed per Venting section and local code.

PART 12. START-UP PROCEDURE

FOR YOUR OWN SAFETY READ BEFORE OPERATING

1. This appliance does not have pilot. It is equipped with an ignition device which automatically lights the burner. Do not try to light the burner by hand.

2. BEFORE OPERATING smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

WHAT TO DO IF YOU SMELL GAS

• Do not try to light any appliance.
• Do not touch any electric switch; do not use any phone in your building.
• Immediately call your gas supplier from a neighbor’s phone. Follow the gas suppliers’ instructions.

• If you cannot reach your gas supplier, call the fire department.

3. Turn on gas shutoff valve (located inside of the Boiler) so that the handle is aligned with the gas pipe. If the handle will not turn by hand, don’t try to repair it, call a qualified service technician. Force or attempted repair may result in a fire or explosion.

4. Do not use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.

5. The Munchkin Boiler shall be installed so the gas ignition system components are protected from water (dripping, spraying, rain, etc.) during appliance operation and service (circulator replacement, condensate trap, control replacement, etc.)
A. OPERATING INSTRUCTIONS

Remove boiler cover. If you smell gas, STOP. Follow listed safety instructions. If you do not smell gas, follow the next steps.

1. Turn on all electric power to appliance.

2. Adjust the temperature setpoint of the Munchkin Boiler if desired. The factory default setting is 180°. If changes are necessary follow “Adjusting The Munchkin Setpoint” in this section.

3. Set the thermostat to the desired setting.

4. If the appliance fails to start, refer to the Troubleshooting section in the back of this manual.

B. ADJUSTING THE SETPOINT

1. Before you can change the temperature from the factory setting of 180 degrees. You must make sure that none of the thermostats are calling for heat. The controller will not memorize a program setting while in a heating cycle. To adjust the temperature to the Munchkin simply press in the \text{S3/Program} key for three seconds until you see a flashing (C) then an alternate value of (180). This number is the factory set point of the unit, which is 180 degrees. To change the temperature, simply push either the \text{S1/-} (Decrease Value) or \text{S2/+} (Increase Value) Ranges 5° F to 30° F. Press the \text{S3/Program} key again and you will see the Indirect Setting and an alternate value of 119 \text{(with Vision Systems)} To adjust, press either \text{S1/-} Decrease Value or \text{S2/+} (Increase Value).

The final adjustment in this mode is the Fahrenheit to Celsius measurement. Press the \text{S3/Program} key again and you will see the Fahrenheit measurement. Simply press in the \text{S3/Program} key to get to next value, the Munchkin Boiler differential setting will appear in the display ch and alternating value of 30. This allows the installer to adjust the activation of the burner based on the differential temperature setting of the Munchkin. The burner will not start until the outlet water temperature reaches a temperature that is equal to the temperature setting for the Munchkin Boiler, minus the differential EX: The Boiler is set to heat at 180° F degrees and the differential is set at 30° F. The burner will not start until the outlet temperature of the system reaches 149° F degrees (180° - 30° F = 150° F). To adjust, press either \text{S1/-} (Decrease Value) or \text{S2/+} (Increase Value)

Ranges 5° F to 30° F. Press the \text{S3/Program} key again and you will see the Indirect Setting and an alternate value of 119 \text{(with Vision Systems)} To adjust, press either \text{S1/-} Decrease Value or \text{S2/+} (Increase Value).

C. STATUS MENU

Installers are also able to check the current status of the Munchkin Boiler parameters by pressing \text{S4/RESET} key for 3 seconds. Once activated, the display will show \text{d1} alternating value of the actual outlet temperature. Actual values are displayed for each function. To view the next value simply press the \text{S4} key to go to the next displayed value. Listed below are the values which can be displayed. These values cannot be changed. To exit this menu, simply press \text{S3/Program} key to resume normal operation.

**D. TEST MODE**

This function is intended to simplify the gas valve adjustment if needed. Listed below are the recommended limits on each Munchkin Boiler and the Combustion Settings. Automatic modulation does not take place when the controller is in Test mode, only temperature limitation based on the Munchkin Boiler Central Heating set point. The user will be allowed to increase or decrease the fan speed by pressing in either the \( S1/- \) or \( S2/+ \) keys.

To activate the Test mode simply press the \( S2/+ \) and \( S3/Program \) key together for 1 second. Once activated, you will see in the display \( \text{Ser} \) and the actual fan speed. The measurement of the combustion levels should always be taken at the highest and lowest fan speed. After 10 minutes, the Test mode stops automatically. To exit Test Mode press \( S1/- \) and \( S2/+ \) key together for 1 second.

**COMBUSTION SETTINGS**

</tr>
</tbody>
</table>

**PART 13: START-UP PROCEDURES WITH THE VISION 1**

The Vision I option allows the user to have one temperature for central heating and another temperature for the Super Stor Ultra Indirect Fired Water Heater. This allows the user to increase the temperature supplied to the Super Stor Ultra indirect water heater to get a fast recovery by prioritizing the flow at a higher temperature than may be needed for the Central Heating Circuits (this will require two separate circulators). Once the Super Stor Ultra Indirect is satisfied, the Vision I system will switch back to the Central Heating Circuit to continue to heat the living space at a temperature based on outside temperature. This gives you a higher comfort level and further increases the efficiency of the Munchkin Boiler.

**A. PROGRAMMING THE VISION I OPTION**

The Vision I allows the installer to set system limits and the heat curve for the Munchkin Boiler. These system limits should not be changed by the user. It is important to document your settings within this manual after you program the system parameters so this will be recorded for future reference.

**B. VISION 1 PROGRAM ACCESS**

To start, press down and hold the \( S/3 \) and \( S/4 \) simultaneously for three seconds. You will notice that the display will change to \( 000 \). Then, with your \( S1/- \) key on the display press down until you see \( 925 \). This is the pass code. To confirm that
the pass code is correct, you will need to press and hold the {S3/Program} for 1 second to confirm. If the pass code is entered incorrectly, the controller program function will be cancelled and the control returns to normal operation. If the code is entered correctly, the control will switch off the gas valve and purge fan while showing a solid |---| in the display. The display will then show a 1 alternating to 40. This first function verifies that the control will address the requirements of the Superstor Indirect Fired Water Heater.

C. VISION 1 PROGRAM NAVIGATION

Next you will have to press the {S/3} key to move through each function. To increase or decrease a value, you will need to press either the {S/1} key or {S/2+} key to change the default values. If there is no key action for 1 minute, the display returns to normal operation. Changes are effective immediately but not directly stored until the {S/4} key is pressed down for 3 seconds then the new values are stored. Listed below are the variety of functions the installer can program into the Vision I System.

**NOTE:** See Chart 13-1 in Part 13 to set outdoor reset curve.

* Central Heating Curve Function

---

The central heating demand is detected when the room thermostat closes. When an outside sensor is also connected, the supply temperature will depend on the factory default central heating curve.

To set your heat curve you will have to set the following parameters:

1. Minimum outside design temperature: **Function 8**
2. Design Supply water temperature at the minimum design outside temperature: **Function 9**
3. Maximum outside design temperature: **Function 10**
4. Design Supply water temperature at the maximum outside temperature: **Function 11**

---

**NOTICE**

It is important to note that the homeowner can adjust the heat curve down by adjusting the central heating temperature to a lower setting.

### A. MUNCHKIN ERROR CODE

An error code may occur in the installation of the Munchkin. This condition may lead to a lock out condition of the controller, which will need to be manually reset through the S4/Reset button. These temporary codes will help the installer correct the problem before going into a lock out condition, which will require a manual reset.

### B. BOILER ERROR

1. When an error condition occurs the controller will display an error code on the display module.
2. These error codes and several suggested corrective actions are included in Table 14-1.
3. In the case of E00, E13, and E14 this error, if uncorrected, will go into a fault condition as described is Paragraph C (Boiler Fault).

### C. BOILER FAULT

1. When a fault condition occurs the controller will illuminate the red “fault” indication light and display a fault code in the format (Example: |F00|) on the display module.
2. Note the fault code and refer to Table 14-2 for an explanation of the fault code along with several suggestions for corrective actions.
3. Press the reset key to clear the fault and resume operation. Be sure to observe the operation of the unit to prevent a recurrence of the fault.

#### Table 14-1 : 925 Control Board ERROR Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Duration</th>
<th>Corrective Action</th>
</tr>
</thead>
</table>
| E00  | High Limit Exceeded | 50 Sec. | 1. Check circulation pump operation.  
2. Assure that there is adequate flow through the boiler by accessing the status menu and assuring that there is less than a 50°F rise from the return thermister to the supply thermister.  
3. Replace switch if faulty. |
| E13  | Combustion Fan Speed Low. The boiler combustion air fan speed less than 70% of expected. | 60 Sec. | 1. Check the combustion air fan wiring.  
2. Replace the combustion air fan.  
3. Replace the control board. |
| E14  | Combustion Fan Speed High. The boiler combustion air fan speed is more than 130% of expected. | 60 Sec. | 1. Check the combustion air fan wiring.  
2. Replace the combustion air fan.  
3. Replace the control board. |
| PR0  | Water Pressure Switch Open | Until Corrected | 1. Assure that the system pressure is above 10 psig.  
2. Check for leaks in the system piping. |
| FLU  | Blocked Vent Pressure Switch Open | Until Corrected | 1. Assure that the vent is not blocked  
2. Check the switch operation by applying a jumper. (If the switch is not functioning properly, replace it.) |
PART 14: TROUBLESHOOTING (CONTINUED)

Table 14-2: 925 Control Board FAULT Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Remedy</th>

<tbody>
<tr>
<td>F00</td>
<td>High Limit Exceeded.</td>
<td>1. Check circulation pump operation. 2. Assure that there is adequate flow through the boiler by accessing the status menu and assuring that there is less than a 50°F rise from the return thermistor to the supply thermistor. 3. Check thermistor reading on supply thermistor. Replace switch if faulty. 4. If this is a new installation, disconnect the two light grey wires from the zone control, and twist the wires together. Depress the S4 reset button. If the fault clears, the problem is outside the boiler. 5. If this is an existing installation with glycol in it, check the condition of the water pressure switch. It may be necessary to jump out the water pressure switch (temporarily only, as a trouble shooting aid) The 24 VAC signal, may have grounded through the glycol if the water pressure switch is leaking.</td>
</tr>
<tr>
<td>F01</td>
<td>Vent Temperature Limit Exceeded.</td>
<td>1. Push the red reset button on the switch. 2. Check the flue temperature during operation using a combustion analyzer. 3. Replace the vent limit switch if faulty. 4. Verify the combustion drain if clear and draining properly. 5. Visually inspect the target wall to see if it is intact. If not intact replace target wall.</td>
</tr>
<tr>
<td>F02</td>
<td>Interrupted or Shorted Supply (Outlet) Thermistor.</td>
<td>1. Check the electrical connection to the thermistor on the outlet manifold. Verify 5 VDC by checking in Molex connector. Verify thermistor values by referencing chart in this manual. 2. Replace thermistor if necessary.</td>
</tr>
<tr>
<td>F03</td>
<td>Interrupted or Shorted Return (Inlet) Thermistor.</td>
<td>1. Check the electrical connection to the thermistor on the inlet manifold. Verify 5 VDC by checking in Molex connector. Verify thermistor values by referencing chart in this manual. 2. Replace thermistor if necessary.</td>
</tr>
<tr>
<td>F05</td>
<td>Supply (Outlet) Temperature exceeds 230°F.</td>
<td>1. Check circulation pump operation. 2. Assure that there is adequate flow through the boiler by accessing the status menu and assuring that there is less than a 50°F rise from the return thermistor to the supply thermistor.</td>
</tr>
<tr>
<td>F06</td>
<td>Return (Inlet) Temperature Exceeded 230°F.</td>
<td>1. Check circulation pump operation. 2. Assure that there is adequate flow through the boiler by accessing the status menu and assuring that there is less than a 50°F rise from the return thermistor to the supply thermistor. 3. Check direction of flow on boiler circulator. (See Piping Details in this manual.)</td>
</tr>
<tr>
<td>F09</td>
<td>No flame detected – The boiler will make three attempts at ignition before the control goes into this lockout condition. *See spark electrode detail.</td>
<td>1. Monitor the gas pressure to the unit while in operation. 2. Assure that the flame is stable when lit. 3. Check to see if the green light on the display module is out while the boiler is running. 4. If the green light doesn’t come on or goes off during operation check the flame signal on the status menu. 5. If the signal reads less than 1 microampere, clean the flame rectifier probe. 6. If the flame rectifier probe continues to read low, replace it. 7. Check the stability of the flame rectification signal. If the signal is unstable, you may need to replace the burner gasket.</td>
</tr>
<tr>
<td>F10</td>
<td>Loss of Flame Signal – The boiler will relight 4 times before the control goes into this lockout condition.</td>
<td>1. Turn the gas off to the unit at the service valve. 2. If the flame signal is still present replace the igniter. 3. If the flame signal is not present after turning off the gas supply, check the gas valve electrical connection. 4. If there is no power to the gas valve, remove the valve and check for obstruction in the valve seat or replace the gas valve. 5. Turn the gas on at the service valve after corrective action is taken. 6. Check for condensate back up. Condensate back up can damage the refractory wall, if the wall falls against the rectifier probe, it may conduct the signal to ground, giving a false reading.</td>
</tr>
<tr>
<td>F11</td>
<td>False Flame Signal – The boiler will lock out if it senses a flame signal when there should be none present.</td>
<td>1. Watch the igniter through the observation window provided. 2. If there is no spark, check the spark electrode for the proper ¼” gap. Use 2 quarters together as a gauge to hold ignitor against to check gap distance. 3. Remove any corrosion from the spark electrode and flame rectifier probe. 4. If there is a spark but no flame, check the gas supply to the boiler. 5. If there is a flame, check the flame sensor. 6. Check any flue blockage or condensate blocks.</td>
</tr>
<tr>
<td>F13</td>
<td>Combustion Fan Speed Low – The boiler will lock out if it senses that the fan speed is less than 70% of expected rate for more than 60 seconds.</td>
<td>1. Check the combustion air fan wiring. 1a. Check the quality of the 24 VAC signal by measuring from any connected safety to ground. A low voltage situation may cause a &quot;false&quot; error code 2. Replace the combustion air fan. 3. Replace the control board.</td>
</tr>
<tr>
<td>F14</td>
<td>Combustion Fan Speed High – The boiler will lock out if the fan speed is more than 130% of expected rate for more than 60 seconds.</td>

If there is a spark but no flame, check the gas supply to the boiler. 5. If there is a flame, check the flame sensor. 6. Check any flue blockage or condensate blocks.

1. Turn the gas off to the unit at the service valve. 2. If the flame signal is still present replace the igniter. 3. If the flame signal is not present after turning off the gas supply, check the gas valve electrical connection. 4. If there is no power to the gas valve, remove the valve and check for obstruction in the valve seat or replace the gas valve. 5. Turn the gas on at the service valve after corrective action is taken. 6. Check for condensate back up. Condensate back up can damage the refractory wall, if the wall falls against the rectifier probe, it may conduct the signal to ground, giving a false reading.

1. Check the combustion air fan wiring. 1a. Check the quality of the 24 VAC signal by measuring from any connected safety to ground. A low voltage situation may cause a “false” error code 2. Replace the combustion air fan. 3. Replace the control board.

1. Check the combustion air fan wiring. 2. Replace the combustion air fan. 3. Replace the control board.

1. Check circulation pump operation. 2. Assure that there is adequate flow through the boiler by accessing the status menu and assuring that there is less than a 50°F rise from the return thermistor to the supply thermistor.
PART 15: MAINTENANCE

A. MAINTENANCE PROCEDURES

Periodic maintenance should be performed once a year by a qualified service technician to assure that all the equipment is in safe efficient operation. The owner can make necessary arrangements with a qualified heating contractor for periodic maintenance of the heater. Installer must also inform the owner that the lack of proper care and maintenance of the heater may result in a hazardous condition. The installer should discuss the contents of the User's Information Manual with the owner.

WARNING

BEFORE EACH HEATING SEASON A trained and qualified service technician should perform the inspections as per the boiler inspection and maintenance schedule in the back of manual. Failure to do so could result in death or serious injury.
**WARNING**

The combustion chamber insulation in this product contains ceramic fiber material. Ceramic fibers can be converted to cristobalite in very high temperature applications. The International Agency for Research on Cancer (IARC) has concluded, “Crystalline silica inhaled in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (Group 1).”:

- Avoid breathing dust and contact with skin and eyes.
- Use NIOSH certified dust respirator (N95). This type of respirator is based on the OSHA requirements for cristobalite at the time this document was written. Other types of respirators may be needed depending on the job site conditions. Current NIOSH recommendations can be found on the NIOSH website at http://www.cdc.gov/niosh/homepage.html. NIOSH approved respirators, manufacturers, and phone numbers are also listed on this website.
- Wear long-sleeved, loose fitting clothing, gloves, and eye protection.
- Apply enough water to the combustion chamber lining to prevent dust
- Wash potentially contaminated clothes separately from other clothing. Rinse clothes washer thoroughly.

**NIOSH stated First Aid.**

- Eye: Irrigate immediately
- Breathing: Fresh air.

**B. COMBUSTION CHAMBER COIL CLEANING INSTRUCTIONS**

*Before beginning this procedure, you must have on hand the following items:*
- a nylon, stainless or brass brush (not steel)
- “Rydlyme” (recommended for best results) (available on line www.rydlyme.com) or “CLR” (available at most hardware stores)
- Gloves, eye protection

1. Shut down the Munchkin Boiler by using the following steps:
   a. Close the gas valve, shut down the unit and wait for the unit to be cool to the touch
   b. Disconnect the condensate hose from the outside connection, **not from the** Munchkin Boiler side), so the flow can be observed.
   c. Disconnect connections from the gas valve, spark electrode and flame rectification probe and combustion blower.
   d. Remove the (4) screws on the aluminum ¼” NPT connector on the gas valve.
   e. Disconnect the wiring connected to the combustion blower motor.
   f. Remove the (6) 10MM nuts from the burner plate assembly to access the coils.
   g. Pull the entire burner plate assembly with blower still attached towards you, while removing or pushing aside any wiring to allow the removal of the assembly.

2. Using a spray bottle filled with the recommended product “RYDLYME” or “CLR”, spray liberally on the coils, making sure the solution penetrates and funnels down through the condensate hose. If the condensate hose is blocked, let the chemical penetrate for at least 15 minutes or until it drains.

3. Use the nylon, stainless or brass brush (do not use steel) and scrub coils to remove any buildup, then vacuum the debris from the coils. WARNING: Follow precautions above

4. Spray the coils with clear water, making sure to confine the spray to the area being cleaned (Try to avoid getting the back ceramic wall of the unit wet). Flush the combustion chamber with fresh water. At this point, the Munchkin should be ready to power back up.

Before powering up the Munchkin Boiler follow the steps below

a. Re-install the burner assembly
b. Tighten the (6) 10MM nuts to the burner plate
c. Re-connect all wiring connections
e. Replace the (4) screws on the aluminum ¼” NPT connector on the gas valve. **(IMPORTANT: CHECK FOR GAS LEAKS)**

f. Re-set thermostats **(IMPORTANT: MAKE SURE EXHAUST VENT IS NO LONGER BLOCKED!)**
g. Turn the Munchkin Boiler back on and observe condensate flow.
h. Re-connect the condensate hose to the outside connection.
**PART 15: MAINTENANCE (CONTINUED)**

## Notes:

- Date completed: _______________
## BOILER INSPECTION AND MAINTENANCE SCHEDULE

<table>
<thead>
<tr>
<th>Inspection Activities</th>
<th>Date last completed</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Piping</strong></td>
<td>1st Year</td>
</tr>
<tr>
<td>Near Heater Piping</td>
<td>Check heater and system piping for any sign of leakage, verify proper support</td>
</tr>
<tr>
<td>Vent</td>
<td>Check condition of all vent pipe and joints</td>
</tr>
<tr>
<td>Gas</td>
<td>Check gas piping, test for gas leaks and signs of aging, make sure all pipes are supported properly.</td>
</tr>
<tr>
<td><strong>System</strong></td>
<td></td>
</tr>
<tr>
<td>Visual</td>
<td>Do a full visual inspection of all system components</td>
</tr>
<tr>
<td>Functional</td>
<td>Test all functions of the system (Heat, DHW, Safeties)</td>
</tr>
<tr>
<td>Temperatures</td>
<td>Verify safe settings on Super-Stor indirect fired water heater or Anti-Scald Valve (see part 12 for related safety warnings)</td>
</tr>
<tr>
<td>Temperatures</td>
<td>Verify temperature settings programmed into the heating curve (see Part 13)</td>
</tr>
<tr>
<td><strong>Electrical</strong></td>
<td></td>
</tr>
<tr>
<td>Connections</td>
<td>Check wire connections, make sure they are tight</td>
</tr>
<tr>
<td>Circuit breakers</td>
<td>Check to see that the circuit breaker is clearly labeled, exercise circuit breaker</td>
</tr>
<tr>
<td>Switch and Plug</td>
<td>Verify ON/OFF switch and convenience plug are both functional</td>
</tr>
<tr>
<td>Smoke and CO detector</td>
<td>Verify devices are installed and working properly, change batteries if necessary</td>
</tr>
<tr>
<td><strong>Chamber and Burner</strong></td>
<td></td>
</tr>
<tr>
<td>Combustion Chamber</td>
<td>Vacuum Combustion Chamber if Necessary</td>
</tr>
<tr>
<td>Combustion Chamber</td>
<td>Check burner tube, and combustion chamber coils, clean according to maintenance section of manual</td>
</tr>
<tr>
<td>Spark Electrode</td>
<td>Clean with scotch brite, Set gap at 1/4” (see Fig 14-2 Part 14 in Troubleshooting section)</td>
</tr>
<tr>
<td>Flame Probe</td>
<td>Clean with scotch brite, Check ionization in μA (d7 on status menu in Start-up Procedures) record high fire (3.8 to 4.2) and low fire (3.0 to 3.4)</td>
</tr>
</tbody>
</table>

* NOTE: CONTINUE MAINTENANCE BEYOND THE 4TH YEAR IS REQUIRED ON A YEARLY BASIS.
<table>
<thead>
